

Autenticación con JWT (Express)

Utilizando la libreria jsonwebtoken

```
const jwt = require('jsonwebtoken')
const jwtdecode = require('jwt-decode')
const SECRET = 'AzksyqlaiekspwkjscTF2233kalzaskeft'
```

```
let hora = () => Math.floor(new Date() / 1000)
```

```
function generarToken(usuario) {
  let payload = {
    sub: usuario,
    roles: ["ADMIN", "USER"]
  }
  let token = jwt.sign(payload, SECRET, {expiresIn: '3s'})

  return token
}
```

```
function verificarToken(token) {
  let objData = null

  console.log(jwtdecode(token))

  try {
    console.log(token)
    objData = jwt.verify(token, SECRET)
  }
  catch (err) {
    console.log(err)
  }
}
```

```
        return {
            valido: false
        }
    }
}
module.exports = {
    generarToken,
    verificarToken
}
```

JWT -DECODE (Express)

```
let jwtUtil = require('./jwtutil')
const jwtdecode = require('jwt-decode')

let token = jwtUtil?.generarToken('misuscriber')

console.log(token)
console.log(jwtdecode(token))

setTimeout(() => {
    console.log(jwtUtil.verificarToken(token))
}, 2000)
```
